

NovaOps Technologies

Custom Domain Email Configuration Guide

Domain: novaopstechnologies.online

Goal: Receive emails through Cloudflare Email Routing and send/reply from custom addresses using Gmail + SMTP2GO.

Planned addresses

Custom address	Forward destination
info@novaopstechnologies.online	novaopstechnologies@gmail.com
support@novaopstechnologies.online	novaopstechnologies@gmail.com
admin@novaopstechnologies.online	novaopstechnologies@gmail.com
karthicksuresh@novaopstechnologies.online	novaopstechnologies@gmail.com

1. Register the domain and connect it to Cloudflare

The domain is registered with Hostinger. Add the domain to Cloudflare and use the Cloudflare-assigned nameservers at Hostinger.

Important: Do not delete the existing website DNS records just because Email Routing is being configured. Website records such as A/ CNAME records may still be required for the website.

Success check: Cloudflare should show the domain status as **Active**.

2. Enable Cloudflare Email Routing

In Cloudflare go to **Compute** → **Email Service** → **Email Routing**, select novaopstechnologies.online, and complete the onboarding.

Cloudflare automatically manages the Email Routing DNS records. If the Email Routing DNS records appear as **Locked**, that is normal; it means Email Service is managing those records.

3. Add and verify the Gmail destination address

Go to **Email Routing** → **Destination addresses**.

Enter your existing Gmail address:

novaopstechnologies@gmail.com

Click **Add address**. Cloudflare sends a verification email. Open it in Gmail and complete verification.

Success check: Destination Addresses should show the Gmail address with status **Verified**.

4. Create Cloudflare routing rules

Go to **Email Routing** → **Routing rules** → **Create routing rule**.

For each address, use the following pattern:

Email pattern	Domain	Action	Destination
info	novaopstechnologies.online	Send to an email	novaopstechnologies@gmail.com
support	novaopstechnologies.online	Send to an email	novaopstechnologies@gmail.com
admin	novaopstechnologies.online	Send to an email	novaopstechnologies@gmail.com
karthicksuresh	novaopstechnologies.online	Send to an email	novaopstechnologies@gmail.com

After saving each rule, test incoming mail from a different/external email account. Avoid testing by sending from the same Gmail account that is the Cloudflare destination, because Gmail/Cloudflare can treat that as a duplicate or routing-loop situation.

5. Create the SMTP2GO account

Create one SMTP2GO account. You do **not** need a separate SMTP2GO account for each custom address.

After account verification, go to **Sending** → **Verified Senders** and verify the domain:

```
novaopstechnologies.online
```

If SMTP2GO provides DNS records for domain authentication, add the records exactly as shown by SMTP2GO in Cloudflare DNS. Do not guess values and do not create a second SPF record if one already exists; follow SMTP2GO's exact instructions.

6. Create ONE SMTP user

Go to **Sending** → **SMTP Users** → **Add SMTP user**.

One SMTP user is enough for all four custom addresses. Example username used during setup:

```
novaopstechnologies.online
```

Create a strong SMTP password and store it securely. Do not share the password in screenshots or chat.

The SMTP server shown by SMTP2GO can be:

```
mail.smtp2go.com
```

For Gmail, use port **587** with **TLS**.

7. Add info@ to Gmail — Send mail as

In Gmail go to **Settings** → **See all settings** → **Accounts and Import** → **Send mail as** → **Add another email address**.

Name: NovaOps Technologies

Email: info@novaopstechnologies.online

Keep **Treat as an alias** checked, then click **Next Step**.

SMTP settings:

Gmail field	Value
SMTP Server	mail.smtp2go.com
Port	587
Username	Your SMTP2GO SMTP user (the one you created)
Password	Your SMTP2GO SMTP user password
Security	TLS

Gmail sends a verification message to info@. Because Cloudflare forwards that address to your Gmail destination, the verification message should arrive there. Click the Gmail confirmation link.

8. Make replies use the correct custom address

In Gmail → **Settings** → **Accounts and Import**, under **Send mail as**, make sure info@ is verified.

Under **When replying to a message**, select:

Reply from the same address to which the message was sent

Do not select 'Always reply from default address' if you want a reply to an email sent to info@ to go out from info@.

Important test: Send a test message to info@ from a different email account. Then reply from Gmail and check the From address. Testing by sending from the same Gmail destination can produce confusing Cloudflare/Gmail duplicate-routing messages.

9. Add the other custom addresses in Gmail

Repeat the same Gmail 'Send mail as' process for:

- support@novaopstechnologies.online
- admin@novaopstechnologies.online
- karthicksuresh@novaopstechnologies.online

Use the **same SMTP server, same SMTP username, and same SMTP password** for all three. Each address must be verified by Gmail.

10. Final email flow

Incoming:

info@ / support@ / admin@ / karthicksuresh@ → Cloudflare Email Routing → novaopstechnologies@gmail.com

Outgoing:

Gmail → SMTP2GO → recipient

The recipient should see the selected custom address as the sender, e.g. info@novaopstechnologies.online.

11. Troubleshooting checklist

Gmail says 'Couldn't connect to the server': Use mail.smtp2go.com, port 587, TLS, and the SMTP2GO SMTP-user credentials. Do not use Cloudflare MX hosts such as route3.mx.cloudflare.net as the SMTP server.

Custom address says unverified: Open the verification email delivered to the custom address and click the Gmail confirmation link.

Reply is sent from Gmail instead of the custom address: In Gmail Accounts and Import, choose 'Reply from the same address to which the message was sent.'

Cloudflare warning about missing/duplicate email: Avoid testing by sending from the same Gmail account that is the Cloudflare destination. Test from an external email account.

SMTP2GO dashboard does not need to stay open: Once Gmail is configured, Gmail uses SMTP2GO's SMTP service when sending. The website does not need to remain open.

Security notes

Never put your SMTP2GO password in this PDF, a screenshot, or an email. Store it in a password manager. If the password is exposed, change/reset the SMTP user password in SMTP2GO and update Gmail.

This guide records the configuration process discussed in this chat. SMTP2GO, Gmail, Cloudflare, and their free-plan limits/features can change over time; use each provider's current documentation for account-specific limits and policies.
